SPC model

(simple point charge/flexible) water model

[J. Lobaugh and G. A. Voth,

J. Chem. Phys. 106 (1997) 2400]

$$\mathcal{V}_{inter} = \frac{1}{2} \sum_i^{N_O} \sum_{j \neq i}^{N_O} 4\epsilon \left[\left(\frac{\sigma}{R_{O_i O_j}} \right)^{12} - \left(\frac{\sigma}{R_{O_i O_j}} \right)^6 \right] + \sum_m \sum_n \frac{q_m q_n}{R_{ij}^{mn}}$$

Here $R_{O_i O_j}$ is the distance between the i th and j th oxygen and R_{ij}^{mn} is the distance between the m th charge on the i th water molecule and n th charge on the j th molecule.

図 2.1 レナード-ジョーンズポテンシャル

$$v_{LJ}(r) = 4\epsilon \left[\left(\frac{\sigma}{r} \right)^{12} - \left(\frac{\sigma}{r} \right)^6 \right]$$

$$-\epsilon = v_{LJ}(r = 2^{1/6}\sigma)$$

Figure 3 Coordinates of the two oscillators.

$$\Delta U = -\hbar\omega_0 \frac{1}{8} \left(\frac{2e^2}{CR^3} \right)^2$$

Here ω_0 is the angular frequency of the oscillators and C is the force constant of the oscillators.

The intramolecular potential of the water molecule is given by the harmonic parameterization of Kutchiso and Morino,

$$\begin{aligned}
 \mathcal{V}_{intra}^{H_2O} = & \sum_{i=1}^2 \rho_W^2 D_W (b_{OH_i} - b_{OH_{eq}})^2 \\
 & + (1/2) b_{intra} (b_{HH} - b_{HH_{eq}})^2 \\
 & + c_{intra} (b_{OH_1} + b_{OH_2} - 2b_{OH_{eq}}) (b_{HH} - b_{HH_{eq}})^2 \\
 & + d_{intra} (b_{OH_1} - b_{OH_{eq}}) (b_{OH_2} - b_{OH_{eq}}) \quad (1)
 \end{aligned}$$

Here b_{ij} is the bond length between atoms i and j .

Intermolecular potential parameters for SPC water

O-O		H ₂ O

Lennard-Jones Reduced Unit System

FIGURE 5.7 Temperature–density phase diagram for the pure Lennard-Jones (12,6) substance. The vapor–liquid saturation curve was computed using the Nicolas et al. [3] equation of state. The melting lines were taken from Hansen and McDonald [10].

XVI. REDUCED UNITS IN THE L-J POTENTIAL

Now the Lennard-Jones pair potential is described as

$$\phi(r) = 4\epsilon \left[\left(\frac{\sigma}{r} \right)^n - \left(\frac{\sigma}{r} \right)^l \right] \quad (112)$$

We define the dimensionless \tilde{r} and \tilde{t} in the following way

$$r = \sigma \tilde{r}, \quad \frac{d}{dr} = \frac{1}{\sigma} \frac{d}{d\tilde{r}} \quad (113)$$

$$t = \tau \tilde{t}, \quad \frac{d^2}{dt^2} = \left(\frac{1}{\tau} \right)^2 \frac{d^2}{d\tilde{t}^2} \quad (114)$$

$$\tilde{\phi}(\tilde{r}) \equiv \phi(\tilde{r})/\epsilon = 4(\tilde{r}^{-n} - \tilde{r}^{-l}) \quad (115)$$

$$\frac{d\tilde{\phi}(\tilde{r})}{d\tilde{r}} = -4n(\tilde{r}^{-n-1} - \frac{l}{n}\tilde{r}^{-l-1}) \quad (116)$$

The equation of motion in the reduced units become

$$\underbrace{\left(\frac{m_k \sigma^2}{\epsilon \tau^2} \right)}_{=1} \frac{d^2}{d\tilde{t}^2} \tilde{\mathbf{r}}_k = \sum_i 4n(\tilde{r}_{ki}^{-n-1} - \frac{l}{n}\tilde{r}_{ki}^{-l-1}) \times \left(\frac{\tilde{x}_k - \tilde{x}_i}{\tilde{r}_{ki}} \mathbf{i} + \frac{\tilde{y}_k - \tilde{y}_i}{\tilde{r}_{ki}} \mathbf{j} + \frac{\tilde{z}_k - \tilde{z}_i}{\tilde{r}_{ki}} \mathbf{k} \right) \quad (117)$$

TABLE I: Translation of reduced units to real units for Lennard-Jones Argon. $m = 6.63 \times 10^{-26}$ kg, $\epsilon/k_B = 119.8$ K, and $\sigma = 3.405 \times 10^{-10}$ m.

Quantity	Reduced units	Real units
length	$\tilde{r} = 1$	$\leftrightarrow r = \sigma = 3.405 \times 10^{-10}$ m
energy	$\tilde{E} = 1$	$\leftrightarrow E = \epsilon = 1.654 \times 10^{-21}$ J
time	$\tilde{t} = 1$	$\leftrightarrow t = \tau = 2.156 \times 10^{-12}$ s
velocity	$\tilde{v} = 1$	$\leftrightarrow v = \sigma/\tau = 157.95$ m/s
temperature	$\tilde{T} = 1$	$\leftrightarrow T = \epsilon/k_B = 119.8$ K
density	$\tilde{\rho} = 1$	$\leftrightarrow \rho = \sigma^{-3} = 2.533 \times 10^{28}$ m ⁻³
pressure	$\tilde{P} = 1$	$\leftrightarrow P = \epsilon/\sigma^3 = 41.9$ MPa
force	$\tilde{f} = 1$	$\leftrightarrow f = \epsilon/\sigma = 4.858$ pN

$$\text{Then time } \tau = \sqrt{\frac{m_k \sigma^2}{\epsilon}} \quad (118)$$

The velocity and temperature is also described in the reduced units.

$$\dot{\mathbf{r}} = \frac{d\mathbf{r}}{dt} = \frac{d(\sigma\tilde{\mathbf{r}})}{d(\tau\tilde{t})} = \underbrace{\left(\frac{\sigma}{\tau}\right)}_{=\sqrt{\frac{\epsilon}{m}}} \frac{d\tilde{\mathbf{r}}}{d\tilde{t}} \quad (119)$$

$$\text{temperature } \tilde{T} = \frac{k_B T}{\epsilon} \quad (120)$$

$$\begin{aligned} f(v_{ix}) dv_{ix} &= \sqrt{\frac{m_i}{2\pi k_B T}} e^{-\frac{1}{2} \frac{m_i v_{ix}^2}{k_B T}} dv_{ix} \\ &= \sqrt{\frac{1}{2\pi\tilde{T}}} e^{-\frac{\tilde{v}_{ix}^2}{2\tilde{T}}} d\tilde{v}_{ix} = f(\tilde{v}_{ix}) d\tilde{v}_{ix} \end{aligned} \quad (121)$$

$$\text{density } \tilde{\rho} = \rho \sigma^3 \quad (122)$$

$$\text{energy } \tilde{E} = E/\epsilon \quad (123)$$

$$\text{kinetic energy } \tilde{K} = K/\epsilon = \frac{mv^2}{2\epsilon} = \frac{m\tilde{v}^2}{2\epsilon} \frac{\epsilon}{m} = \frac{\tilde{v}^2}{2} \quad (124)$$

$$\text{pressure } \tilde{P} = P\sigma^3/\epsilon \quad (125)$$

$$\text{force } \tilde{\mathbf{f}} = -\tilde{\nabla}\tilde{V} = -\sigma\nabla(V/\epsilon) = (\sigma/\epsilon)\mathbf{f} \quad (126)$$

$$\mathcal{K} = \frac{1}{2}mv^2 = \frac{1}{2}m\frac{\epsilon}{m}\tilde{v}^2 \quad (127)$$

$$\tilde{\mathcal{K}} = \frac{\mathcal{K}}{\epsilon} = \frac{1}{2}\tilde{v}^2 \quad (128)$$

$$\mathcal{T} = \frac{2\mathcal{K}}{3Nk_B} \quad (129)$$

$$\tilde{\mathcal{T}} = \frac{k_B T}{\epsilon} = \frac{2}{3}\frac{\tilde{\mathcal{K}}}{N} \quad (130)$$

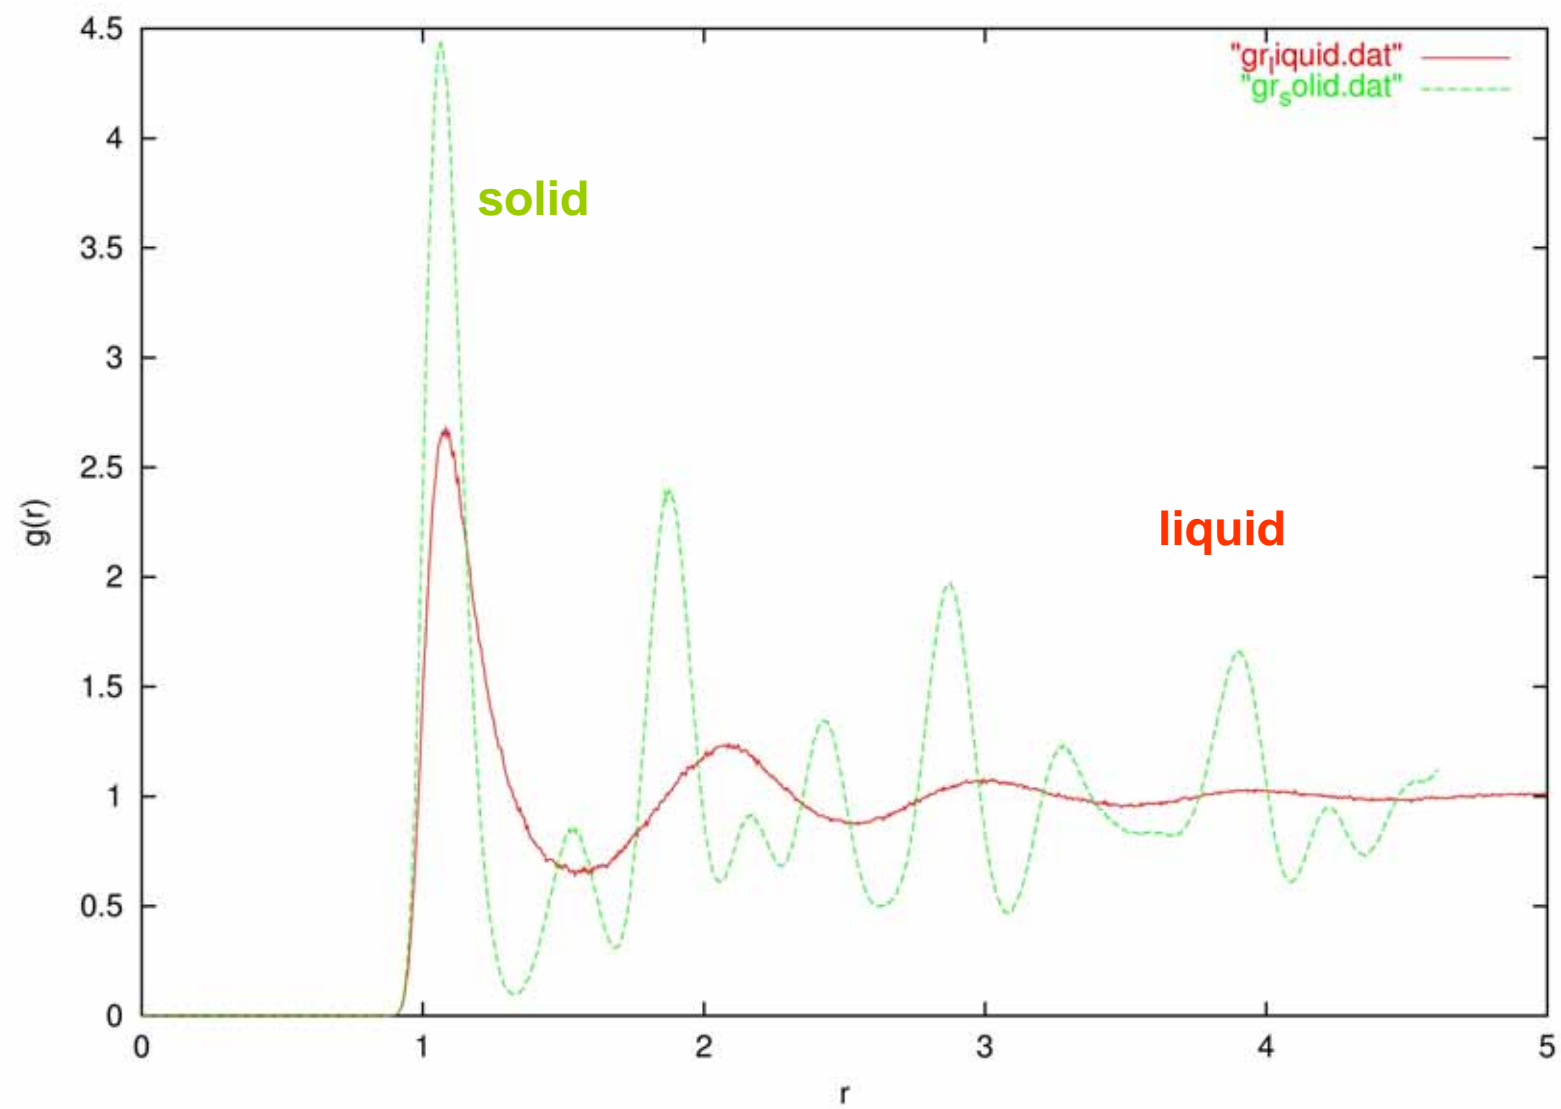

$$\tilde{\mathcal{P}} = \left(\frac{2}{3}\tilde{\mathcal{K}} + \tilde{\mathcal{W}}\right)/\tilde{V} \quad (131)$$

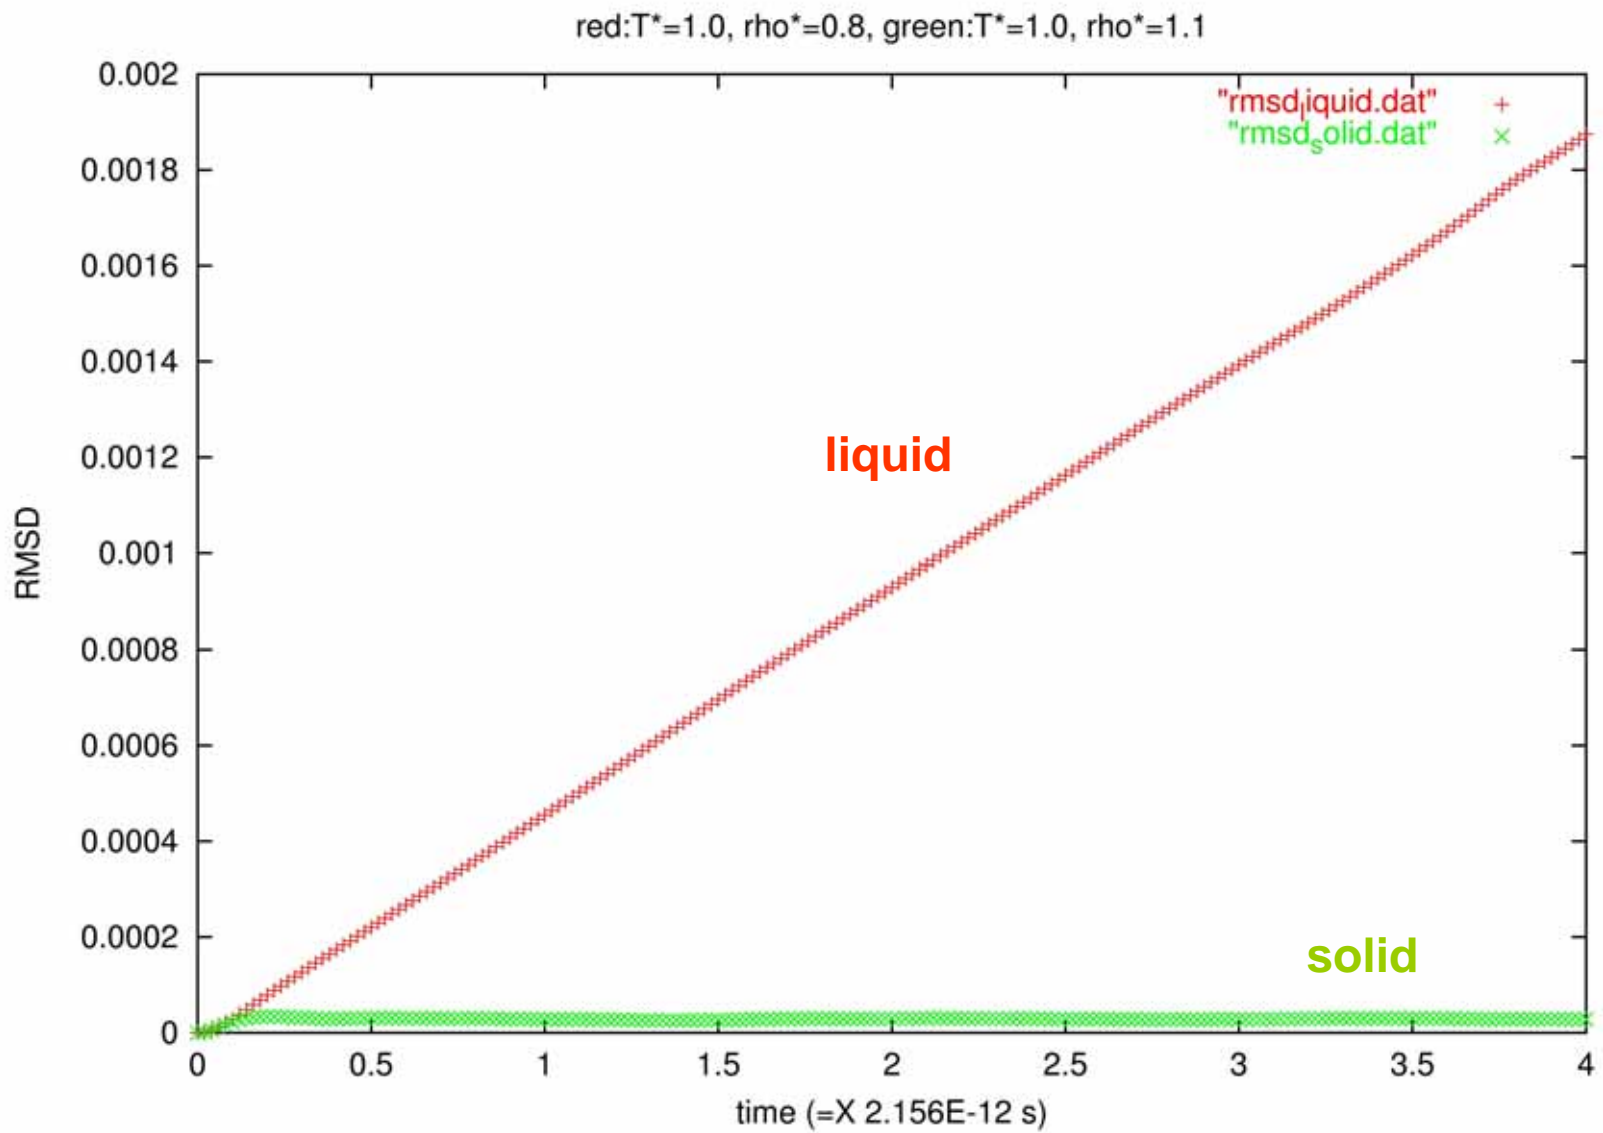

$$\tilde{\mathcal{W}} = -\frac{1}{3}\sum_i\sum_{j>i}\tilde{w}(\tilde{r}_{ij}) \quad (132)$$

$$\tilde{w}(\tilde{r}) = \tilde{r}\frac{d\tilde{v}}{d\tilde{r}} \quad (133)$$

$\{\mathbf{v}_i\}$: velocity

$\{\mathbf{F}_i\}$: Force

Molecular
Dynamics

Monte Carlo
(Energy only)

Pair potential If the interaction between i and j is pairwise, the potential energy is given by

$$\mathcal{V} = \frac{1}{2} \sum_{i,j} \phi(|\mathbf{r}_i - \mathbf{r}_j|) = \sum_{i < j} \phi(|\mathbf{r}_i - \mathbf{r}_j|) \quad (1)$$

The force acting on the atom k can be written as

$$\vec{\mathbf{f}}_k = -\nabla_k \mathcal{V} = - \left(\mathbf{i} \frac{\partial}{\partial x_k} + \mathbf{j} \frac{\partial}{\partial y_k} + \mathbf{k} \frac{\partial}{\partial z_k} \right) \mathcal{V} \quad (2)$$

$$r_{ij} = |\mathbf{r}_i - \mathbf{r}_j|$$

$$= [(x_i - x_j)^2 + (y_i - y_j)^2 + (z_i - z_j)^2]^{1/2}$$

$$\frac{\partial |\mathbf{r}_i - \mathbf{r}_j|}{\partial x_k} = \frac{1}{2} |\mathbf{r}_i - \mathbf{r}_j|^{-1} 2(x_i - x_j)(\delta_{ki} - \delta_{kj}) \quad (4)$$

$$\vec{\mathbf{f}}_k = -\frac{1}{2} \sum_{i,j} \left[\mathbf{i} \phi'(r_{ij}) \frac{x_i - x_j}{r_{ij}} + \mathbf{j} \phi'(r_{ij}) \frac{y_i - y_j}{r_{ij}} + \mathbf{k} \phi'(r_{ij}) \frac{z_i - z_j}{r_{ij}} \right] (\delta_{ki} - \delta_{kj}) \quad (5)$$

$$= - \sum_i \left[\phi'(r_{ki}) \frac{x_k - x_i}{r_{ki}} \mathbf{i} + \phi'(r_{ki}) \frac{y_k - y_i}{r_{ki}} \mathbf{j} + \phi'(r_{ki}) \frac{z_k - z_i}{r_{ki}} \mathbf{k} \right] \quad (6)$$

Periodic Boundary Condition

Minimum image convention

Cutoff

$$r_{\text{cutoff}} < L / 2$$

L:PBC box length

Verlet

If the classical trajectory is continuous, the estimate of the positions at $t + \delta t$ may be given by

$$\vec{r}(t + \delta t) = 2\vec{r}(t) - \vec{r}(t - \delta t) + (\delta t)^2 \vec{a}(t) + O[(\delta t)^4] \quad (1)$$

The velocities do not appear in the above formula. They have been eliminated by addition of the equations obtained by Taylor expansion about $\vec{r}(t)$:

$$\begin{aligned} \vec{r}(t + \delta t) &= \vec{r}(t) + \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t) + \frac{(\delta t)^3}{6} \vec{b}(t) \dots \\ \vec{r}(t - \delta t) &= \vec{r}(t) - \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t) - \frac{(\delta t)^3}{6} \vec{b}(t) \dots \end{aligned}$$

The velocities are not needed to compute the trajectories, but they are useful for estimating kinetic energy. They may be obtained by

$$\vec{v}(t) = \frac{\vec{r}(t + \delta t) - \vec{r}(t - \delta t)}{2\delta t} + O[(\delta t)^2] \quad (2)$$

Velocity Verlet

Firstly, the new velocities at mid-step time $t + (\delta t/2)$ are calculated in the following way.

$$\vec{v}(t + \frac{\delta t}{2}) = \vec{v}(t) + \frac{\delta t}{2} \vec{a}(t) = \vec{v}(t) + \frac{\delta t \vec{f}(t)}{2 m} \quad (1)$$

The new positions are calculated using these velocities at the mid-time-step.

$$\begin{aligned} \vec{r}(t + \delta t) &= \vec{r}(t) + \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t) \\ &= \vec{r}(t) + \delta t \vec{v}(t + \frac{\delta t}{2}) \\ &= \vec{r}(t) + \delta t \left[\vec{v}(t) + \frac{\delta t \vec{f}(t)}{2 m} \right] + O[(\delta t)^4] \end{aligned}$$

The forces and accelerations ($\vec{f} = m\vec{a}$) at time $t + \delta t$ are then computed from $\vec{r}(t + \delta t)$, and the velocity at time $t + \delta t$ is estimated by

$$\begin{aligned} \vec{v}(t + \delta t) &= \vec{v}(t + \frac{\delta t}{2}) + \frac{\delta t}{2} \vec{a}(t + \delta t) \\ &= \vec{v}(t + \frac{\delta t}{2}) + \frac{\delta t \vec{f}(t + \delta t)}{2 m} \end{aligned}$$

Nature 414, 73 - 77 (2001);

Energetics of ion conduction through the K⁺ channel

Simulations and parameters All simulations were carried out using the program CHARMM²³. The total number of atoms in the simulation system is slightly above 40,000 (KcsA, 112 dipalmitoyl phosphatidylcholine (DPPC), 6,532 water molecules, 3 K⁺ in the pore, and 12 K⁺ and 23 Cl⁻ in the bulk solution).
