\[ \nu_{\text{inter}} = \frac{1}{2} \sum_{i}^{N_O} \sum_{j \neq i}^{N_O} 4\varepsilon \left[ \left( \frac{\sigma}{R_{O_iO_j}} \right)^{12} - \left( \frac{\sigma}{R_{O_iO_j}} \right)^6 \right] \]

\[ + \sum_{m} \sum_{n} \frac{q_m q_n}{R_{i,j}^{mn}} \]

Here \( R_{O_iO_j} \) is the distance between the \( i \)th and \( j \)th oxygen and \( R_{i,j}^{mn} \) is the distance between the \( m \)th charge on the \( i \)th water molecule and \( n \)th charge on the \( j \)th molecule.
Figure 3 Coordinates of the two oscillators.

\[ \Delta U = -\bar{\tau}\omega_0 \frac{1}{8} \left( \frac{2e^2}{CR^3} \right)^2 \]

Here \( \omega_0 \) is the angular frequency of the oscillators and \( C \) is the force constant of the oscillators.

\[
v_{\text{LJ}}(r) = 4\epsilon \left[ \left( \frac{\sigma}{r} \right)^{12} - \left( \frac{\sigma}{r} \right)^6 \right]
\]

\[-\epsilon = v_{\text{LJ}}(r = 2^{1/6}\sigma)\]
The intramolecular potential of the water molecule is given by the harmonic parameterization of Kutchiso and Morino,

\[ \mathcal{V}_{\text{intra}}^{H_2O} = \sum_{i=1}^{2} \rho_w^2 D_w (b_{OH_i} - b_{OH_{eq}})^2 \\
+ (1/2)b_{\text{intra}}(b_{HH} - b_{HH_{eq}})^2 \\
+ c_{\text{intra}}(b_{OH_1} + b_{OH_2} - 2b_{OH_{eq}})(b_{HH} - b_{HH_{eq}})^2 \\
+ d_{\text{intra}}(b_{OH_1} - b_{OH_{eq}})(b_{OH_2} - b_{OH_{eq}}) \]  \hspace{1cm} (1)

Here \( b_{ij} \) is the bond length between atoms \( i \) and \( j \).

FIGURE 5.7 Temperature-density phase diagram for the pure Lennard-Jones (12,6) substance. The vapor-liquid saturation curve was computed using the Nicolas et al. [3] equation of state. The melting lines were taken from Hansen and McDonald [10].
XVI. REDUCED UNITS IN THE L-J POTENTIAL

Now the Lennard-Jones pair potential is described as

$$\phi(r) = 4\epsilon \left[ \left( \frac{\sigma}{r} \right)^n - \left( \frac{\sigma}{r} \right)^l \right]$$

(112)

We define the dimensionless $\tilde{r}$ and $\tilde{t}$ in the following way

$$r = \sigma \tilde{r}, \quad \frac{d}{dr} = \frac{1}{\sigma} \frac{d}{d\tilde{r}}$$

(113)

$$t = \tau \tilde{t}, \quad \frac{d^2}{dt^2} = \left( \frac{1}{\tau} \right)^2 \frac{d^2}{d\tilde{t}^2}$$

(114)

$$\tilde{\phi}(\tilde{r}) \equiv \frac{\phi(\tilde{r})}{\epsilon} = 4(\tilde{r}^{-n} - \tilde{r}^{-l})$$

(115)

$$\frac{d\tilde{\phi}(\tilde{r})}{d\tilde{r}} = -4n(\tilde{r}^{-n-1} - \frac{l}{n} \tilde{r}^{-l-1})$$

(116)

The equation of motion in the reduced units become

$$\left( \frac{m_k \sigma^2}{\epsilon \tau^2} \right) \frac{d^2 \tilde{r}_k}{d\tilde{t}^2} \tilde{r}_k = \sum_i 4n(\tilde{r}_{ki}^{-n-1} - \frac{l}{n} \tilde{r}_{ki}^{-l-1}) \times$$

$$\left( \frac{\tilde{x}_k - \tilde{x}_i}{\tilde{r}_{ki}}, \frac{\tilde{y}_k - \tilde{y}_i}{\tilde{r}_{ki}}, \frac{\tilde{z}_k - \tilde{z}_i}{\tilde{r}_{ki}} \right)$$

(117)
TABLE I: Translation of reduced units to real units for Lennard-Jones Argon. \( m = 6.63 \times 10^{-26} \text{ kg}, \epsilon/k_B = 119.8 \text{ K}, \) and \( \sigma = 3.405 \times 10^{-10} \text{ m}. \)

</tr>
</tbody>
</table>

Then time \( \tau = \sqrt{\frac{m_k \sigma^2}{\epsilon}} \) (118)

The velocity and temperature is also described in the reduced units.

\[
\dot{r} = \frac{d\tilde{r}}{d\tilde{t}} = \frac{d(\sigma \tilde{t})}{d(\tau \tilde{t})} = \left( \frac{\sigma}{\tau} \right) \frac{d\tilde{r}}{d\tilde{t}} = \sqrt{\frac{m_k}{\epsilon}}
\] (119)

Temperature \( \tilde{T} = \frac{k_B T}{\epsilon} \) (120)

\[
f(v_{ix})dv_{ix} = \sqrt{\frac{m_k}{2\pi k_B T}} e^{-\frac{1}{2} \frac{m_k v_{ix}^2}{k_B T}} dv_{ix} = \sqrt{\frac{1}{2\pi T}} e^{-\frac{\tilde{v}_{ix}^2}{2\tilde{T}}} d\tilde{v}_{ix} = f(\tilde{v}_{ix})d\tilde{v}_{ix} \quad (121)
\]

Density \( \tilde{\rho} = \rho \sigma^3 \) (122)

Energy \( \tilde{E} = E/\epsilon \) (123)

Kinetic energy \( \tilde{K} = K/\epsilon = \frac{m_{ix}^2}{2\epsilon} = \frac{m \tilde{v}_{ix}^2}{2\epsilon} = \frac{\tilde{v}_{ix}^2}{2} \) (124)

Pressure \( \tilde{P} = P\sigma^3/\epsilon \) (125)

Force \( \tilde{f} = -\nabla \tilde{V} = -\sigma \nabla (V/\epsilon) = (\sigma/\epsilon) f \) (126)
\[ K = \frac{1}{2}mv^2 = \frac{1}{2}m\frac{\varepsilon}{m} \tilde{v}^2 \]  
\[ \tilde{K} = \frac{K}{\varepsilon} = \frac{1}{2} \tilde{v}^2 \]  
\[ T = \frac{2K}{3Nk_B} \]  
\[ \tilde{T} = \frac{k_BT}{\varepsilon} = \frac{2}{3N} \tilde{K} \]  
\[ \tilde{\rho} = \left( \frac{2}{3} \tilde{K} + \tilde{W} \right)/\tilde{V} \]  
\[ \tilde{W} = -\frac{1}{3} \sum_i \sum_{j>i} \tilde{w}(\tilde{r}_{ij}) \]  
\[ \tilde{w}(\tilde{r}) = \tilde{r} \frac{\tilde{d} \tilde{v}}{d \tilde{r}} \]

Molecular Dynamics

Monte Carlo (Energy only)
Pair potential If the interaction between \( i \) and \( j \) is pairwise, the potential energy is given by

\[
\mathcal{V} = \frac{1}{2} \sum_{i,j} \phi(|\vec{r}_i - \vec{r}_j|) = \sum_{i < j} \phi(|\vec{r}_i - \vec{r}_j|) \quad (1)
\]

The force acting on the atom \( k \) can be written as

\[
\vec{f}_k = -\nabla_k \mathcal{V} = - \left( \vec{i} \frac{\partial}{\partial x_k} + \vec{j} \frac{\partial}{\partial y_k} + \vec{k} \frac{\partial}{\partial z_k} \right) \mathcal{V} \quad (2)
\]

\[
\rho_{ij} = |\vec{r}_i - \vec{r}_j|
\]

\[
= \left[ (x_i - x_j)^2 + (y_i - y_j)^2 + (z_i - z_j)^2 \right]^{1/2}
\]

\[
\frac{\partial |\vec{r}_i - \vec{r}_j|}{\partial x_k} = \frac{1}{2} |\vec{r}_i - \vec{r}_j|^{-1/2} \cdot 2(x_i - x_j)(\delta_{ki} - \delta_{kj}) \quad (4)
\]

\[
\vec{f}_k = -\frac{1}{2} \sum_{i,j} \left[ \vec{i} \phi'(r_{ij}) \frac{x_i - x_j}{r_{ij}} + \vec{j} \phi'(r_{ij}) \frac{y_i - y_j}{r_{ij}} + \vec{k} \phi'(r_{ij}) \frac{z_i - z_j}{r_{ij}} \right] (\delta_{ki} - \delta_{kj}) \quad (5)
\]

\[
= -\sum_i \left[ \vec{i} \phi'(r_{ki}) \frac{x_k - x_i}{r_{ki}} + \vec{j} \phi'(r_{ki}) \frac{y_k - y_i}{r_{ki}} + \vec{k} \phi'(r_{ki}) \frac{z_k - z_i}{r_{ki}} \right] \quad (6)
\]
Periodic Boundary Condition
Minimum image convention

Cutoff

$r_{\text{cutoff}} < \frac{L}{2}$

$L: \text{PBC box length}$
Verlet

If the classical trajectory is continuous, the estimate of the positions at $t + \delta t$ may be given by

$$\vec{r}(t + \delta t) = 2\vec{r}(t) - \vec{r}(t - \delta t) + (\delta t)^2 \vec{a}(t) + O[(\delta t)^4]$$

(1)

The velocities do not appear in the above formula. They have been eliminated by addition of the equations obtained by Taylor expansion about $\vec{r}(t)$:

$$\vec{r}(t + \delta t) = \vec{r}(t) + \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t) + \frac{(\delta t)^3}{6} \vec{b}(t) + \ldots$$

$$\vec{r}(t - \delta t) = \vec{r}(t) - \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t) - \frac{(\delta t)^3}{6} \vec{b}(t) + \ldots$$

The velocities are not needed to compute the trajectories, but they are useful for estimating kinetic energy. They may be obtained by

$$\vec{v}(t) = \frac{\vec{r}(t + \delta t) - \vec{r}(t - \delta t)}{2\delta t} + O[(\delta t)^2]$$

(2)
Velocity Verlet

Firstly, the new velocities at mid-step time \( t + (\delta t/2) \) are calculated in the following way.

\[
\vec{v}(t + \frac{\delta t}{2}) = \vec{v}(t) + \frac{\delta t}{2} \vec{a}(t) = \vec{v}(t) + \frac{\delta t \vec{f}(t)}{2m} \quad (1)
\]

The new positions are calculated using these velocities at the mid-time-step.

\[
\vec{r}(t + \delta t) = \vec{r}(t) + \delta t \vec{v}(t) + \frac{(\delta t)^2}{2} \vec{a}(t)
\]

\[
= \vec{r}(t) + \delta t \vec{v}(t + \frac{\delta t}{2})
\]

\[
= \vec{r}(t) + \delta t \left[ \vec{v}(t) + \frac{\delta t \vec{f}(t)}{2m} \right] + O[(\delta t)^4]
\]

The forces and accelerations (\( \vec{f} = m\vec{a} \)) at time \( t + \delta t \) are then computed from \( \vec{r}(t + \delta t) \), and the velocity at time \( t + \delta t \) is estimated by

\[
\vec{v}(t + \delta t) = \vec{v}(t + \frac{\delta t}{2}) + \frac{\delta t}{2} \vec{a}(t + \delta t)
\]

\[
= \vec{v}(t + \frac{\delta t}{2}) + \frac{\delta t \vec{f}(t + \delta t)}{2m}
\]
Simulations and parameters All simulations were carried out using the program CHARMM23. The total number of atoms in the simulation system is slightly above 40,000 (KcsA, 112 dipalmitoyl phosphatidylcholine (DPPC), 6,532 water molecules, 3 K+ in the pore, and 12 K+ and 23 Cl- in the bulk solution).
